**The Metabolism, Structure, and Function of Plant Lipids** Paul K. Stumpf 2012-12-06 The Seventh International Symposium on the Structure and Function of Plant Lipids took place at the University of California, Davis, California July 27th to August 1st, 1986. This was the first time the Symposium was held in the United States. The list of previous host cities reads, Norwich, Karlsruhe, Goteborg, Paris, Groningen, Neuchatel. The addition of Davis to this distinguished list was made by the organizers with the doubts of people who give invitations to parties - will anybody come? In fact 155 participants registered and there were 21 spouses in attendance. The scientific program was composed of nine sessions: biochemistry of isoprenoids and sterols, function of isoprenoids and sterols, structure and function of lipids, biosynthesis of complex lipids, fatty acid oxygenases and desaturases, medium and long chain fatty acids, interaction of university, government and industrial research, algal lipids, and genetics and biotechnology. In addition to these sessions of plenary lectures, there were four poster sessions in which about 140 posters were presented. All of this was packed into four days, and there was some comment about the scarcity of time to ask questions of the speakers, discuss the posters and even to eat lunch. The compression of the program was a result of the continued desire of the organizing committees to avoid concurrent sessions. The congregation of participants into a single session increases interaction and generates a feeling of unity at these symposia.

*Carbohydrates: Structure and Function* Jack Preiss 2014-05-10 *The Biochemistry of Plants: A Comprehensive Treatise, Volume 3: Carbohydrates: Structure and Function* is a compilation of contributions dealing with studies in the area of plant carbohydrates. The articles in this volume are grouped into three sections. The first section deals with topics concerning the monosaccharides and their derivatives found in plants. The integration and control of vital pathways concerned with hexose phosphate metabolism, glycolysis, gluconeogenesis; the metabolism of monosaccharide derivatives; and the formation of sugar nucleotides and their various transformations to the many novel sugar derivatives normally found in plant cell walls and complex carbohydrates are discussed in this section. The second part deals with the occurrence, biosynthesis, and transport of disaccharides and oligosaccharides. The final section of the volume is concerned with the occurrence, structure, and biosynthesis of simple and complex polysaccharides and glycoconjugates associated with cell walls and membranes. Biochemists and botanists will find the book a great reference material.

**Prehistory** Chris Gosden 2018-06-28 *Prehistory* covers the period of some 4 million years before the start of written history, when our earliest ancestors, the Australopithecines, existed in Africa. But this is relatively recent compared to whole history of the earth of some 4.5 billion years. A key aspect of prehistory is that it provides a sense of scale, throwing recent ways of life into perspective. Humans and their ancestors lived in many different ways and the cultural variety we see now is just a tiny fraction of that which has existed over millions of years. Humans are part of

the broader evolution of landscapes and communities of plants and animals, but *Homo sapiens* is also the only species to have made a real impact on planetary systems. To understand such an impact, we need a grasp of our longest term development and ways of life. In this new edition of his *Very Short Introduction*, Chris Gosden invites us to think seriously about who we are by considering who we have been. As he explains, many new discoveries have been made in archaeology over the last ten years, and a new framework for prehistory is emerging. A greater understanding of Chinese and central Asian prehistory has thrown Eurasian prehistory in quite a different light, with flows of the influence of culture over large areas now evident. This has eaten away at the traditional view of human progress around the invention of agriculture, the development of cities, and (much later) the industrial revolution, and has given us new geographies to think about. Chris Gosden explores the new landscape of our prehistory and considers the way the different geographical locations weave together. **ABOUT THE SERIES:** The *Very Short Introductions* series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.
